NEWS RELEASE

July 13, 2009

**SEGO RECEIVES FINAL INTERPRETATION REPORT FROM
QUANTEC GEOSCIENCE**

Sego Resources has received the “Geophysical Survey Interpretation Report” from Quantec Geoscience.

The report details results of the Quantec Titan 24 survey of DC Resistivity and Induced Polarization which Quantec did at the Sego Resources Miner Mountain Property from April 25th to May 4th of 2009.

The report and maps showing the survey results will be posted on Sego's website www.segoresources.com

The DC/IP Titan 24 survey identified 23 potential targets with various priority levels based on the depth and geophysical parameters. These 23 targets group into 18 geographic areas.

Within the Nicola Volcanic Terrane, at the Miner Mountain Property where Sego has defined through trenching and drilling zones of Copper – Gold (Silver) mineralization (see Sego NR April 24, 2008, June 20, 2008, November 18, 2008), the Titan 24 survey identified 15 chargeability zones which group into 9 areas spread along a 500 – 1000 metre wide belt, stretching 2.5 kilometres from the southwest of the property to the northeast.

This zone appears to come to surface at the southwest and northeast areas. In particular at the southwest end, significant gold and copper mineralization has been found: Trench 36 - 32m of 0.29% Cu and 1.00 G/T Au, Trench 37 - 4m 0.19% Cu and 1.15 G/T Au, and Trench 42 - 10 metres 1.18% Cu with diagnostic alkalic porphyry alteration (see Sego NR June 5, 2008).

Sego has received permits for trenching and plans 8 trenches to explore the southwest and northeast ends as an initial exploration of the chargeability targets.

This Press Release was approved by Chris Sampson P.Eng. a Qualified Person as defined by NI 43-101.
