NEWS RELEASE

February 09 2010

**Sego Drills 62.79 metres 0.355% Cu
0.165 g/t Au 2.52 g/t Ag (includes 6.1 m of 0.91% Cu, 0.54 g/t Au)
at Miner Mountain**

Sego Resources is pleased to report further copper and precious metal grades from the drilling program in the Granby Zone at the Miner Mountain Project.

**DDH-MM-09-11 62.79 metres 0.355% Cu, 0.165 g/t Au 2.52 g/t Ag, from 15.85m - 78.64 m
including 10.76 metres of 0.48% Cu, 0.24 g/t Au and 3.38 g/t Ag from 35.97m to 46.73 m**

- **27.44 metres of 0.49% Cu, 0.26 g/t Au and 3.38 g/t Ag from 51.2 m – 78.64 m including 6.1 m of 0.91% Cu, 0.54 g/t Au from 72.54 m – 78.64m**
- **A second zone from 137.55m to 172.64m (35.09m) was mineralized with up to 2688 ppm copper.**

This new drilling builds upon the Sego 2008 program which encountered mineralized intercepts in holes 4,5,9 and 11 from 2009 (see Nov. 18th 2008 News Release) and indicates a northward dipping upper zone of copper-precious metal mineralization (see Map on our website www.segoresources.com).

Analysis of both the 2008 and 2009 drilling has confirmed the presence of Alkalic Porphyry Copper style mineralization, lithology and alteration. At Miner Mountain there is an enrichment in Platinum group elements, Albitic and Potassic alteration, the presence of sub-volcanic breccias and a zonation of sulphides from pyrite to chalcopyrite/bornite and bornite with chalcocite and covellite. Alkalic Porphyry Copper-Gold deposits form an important class of Porphyry Copper deposits in British Columbia which includes Mt Polley, Red Chris, Galore Creek, Afton, Ajax, and Copper Mountain.

The Granby Zone is open to the north and east, and the company is planning a spring core drilling program to further enlarge the known zone of mineralization.

Two holes were also drilled in the South Zone and Sego is currently awaiting metallic assays.
