NEWS RELEASE
March 3, 2010
South Zone Drilling Results

Sego Resources reports the results of the 2009 South Zone drilling program. The South Zone produced gold and copper values in the 2009 trenching program (see Sept 9th 2009, Oct 7th 2009, Oct 26th 2009 NR). Petrographic analyses and detailed mapping have identified multiple intrusive phases, and mineralized sub-volcanic breccias with magnetite, and potassic alteration.

The drill was located at the intersection of trenches 35, 80, and 87. Holes 09-12 and 09-13 were drilled from this location to test the mineralization at depth. Both holes intersected potassic and albitic alteration with elevated gold and copper values. A nugget effect has been identified in the assaying of gold values which may indicate the presence of coarse gold. Further trenching and mapping are planned for this zone. Results confirm the Quantec Titan 24 IP anomalies.

The Granby Zone (See Feb 09, 2010 NR) is open to the north and east, and the company is planning a spring core drilling program to further enlarge the known zone of mineralization. Drilling is planned for Mid March 2010.

This Press Release was reviewed by Vic Preto, Ph.D, P.Eng. a Qualified Person as defined by NI 43-101.
