## **NEWS RELEASE**

April 20, 2011

### **Sego Percussion Drilling Extends Zone 150 metres West**

Sego Resources Inc. reports that the fire assay results from the final 12 holes of the recent percussion drill program have been received. The grid drilling was over a gossan cap and a titan 24 IP anomaly (2km x 250m) known as the Cuba Zone. The following results are from the west end of the grid and indicate a new mineralized zone upslope from the Regal Zone at the west edge of the drilling. Elevated gold results have been located in highly altered rock, percussion drill hole 34 is located approximately 150 metres west of percussion drill hole 9 (see news release April 5, 2011).

Geological cross-sections are being prepared and a multi-year permit application will be submitted to enable the company to conduct exploration without breaks for permit changes.
